---

The selection of the correct instrumentation to accompany a flow meter is critical. Many flow metering applications are compromised by the incorrect specification of the control or process indication. The chart below shows the basic functions of our standard instruments but the web details are not complete as we would rather specify an alternative indicator or control product than compromise the flowmeters performance by using an in- appropriate product. In all cases when an instrument is purchased from us we will calibrate the instrument for the application using the flow parameters provided by the customer. All of the equipment we offer is suitable for our positive displacement, turbine or insertion turbine meters. In some cases the indicator may be mounted directly on the flow sensor and be self contained with no external power required.
