## 1x31 Coaxial Tree > 750 MHz

## verview

The SMP6103 is a very high-density coaxial tree, and is designed for high-fidelity RF switching applications up to 750 MHz . Excellent crosstalk and isolation is maintained by using RF relays with bandwidths in excess of 2.0 GHz along with short low-loss coaxial runs from the connector directly to the relays.

All modules are also configured to avoid any unterminated stub effects, improving overall signal integrity and allowing for larger high-frequency multiplexer configurations while maintaining bandwidth and VSWR. The front panel contains two high-density, 26-pin coaxial connectors designed for high reliability and superior signal integrity.

The SMP6103 is part of the SMIP/ITM family and can be mixed and matched with other SMIP $/ I^{T M}$ modules to configure high-density switching systems. For example, approximately $18050 \Omega$ coaxial switch points can be switched within a double slot VXI card (SMP1200), providing exceptional density without degrading signal integrity.
